Organised Mess is a creative technology studio and experimental design practice.
—

We design and build systems at the intersection of art and technology — working across objects, environments, and the physical world.

We work with artists, institutions, and organisations to develop projects from research through to deployment.

About Us

Our process is exploratory but disciplined. We test early, iterate quickly, and develop systems that are materially grounded and technically robust. We pair the right people with the right project, working closely with clients and partners throughout.

We work across art and commercial contexts — experimental installations, custom hardware systems, spatial interventions. The focus stays the same: clarity of structure, integrity of execution. We build a small number of projects each year, moving through research, prototyping, and fabrication — from concept to deployment.

We value transparency, clear communication, and long-term relationships.
The best work happens when trust and curiosity are shared.

How we work

Systems & Prototyping
- Developing experimental systems through research, hardware development, and iterative testing.

Spatial & Installation
- Designing and building responsive environments, spatial interventions, and interactive installations.

Product & Tool Development
- Custom hardware, software, and hybrid tools for art, culture, and industry.

Research & Technical Direction
- Technical strategy, system architecture, and research & development support for projects.

Our capabilities

Technology
- Custom hardware, embedded systems, physical computing, interactive systems, real-time environments, experimental fabrication.

Design
- System architecture, interaction design, spatial thinking, experience prototyping.

Strategy
- Technical feasibility, system planning, translating complex ideas into deployable outcomes.
